

## SOUNDPROOFING & PARKING GARAGES

Spray applied acoustical materials make soundproofing any space possible. This is the perfect application for parking garages, as it serves the dual purpose of insulating and soundproofing. It is an ideal application for office spaces and can be installed in custom colours. We also utilize spray foam insulation for several of our sound proof wall systems.

- + Parking garage insulating and soundproofing systems
- + Custom sound proofing design for walls and ceilings
- + Air sealing and soundproofing eliminates sounds and smells from neighbouring tenants

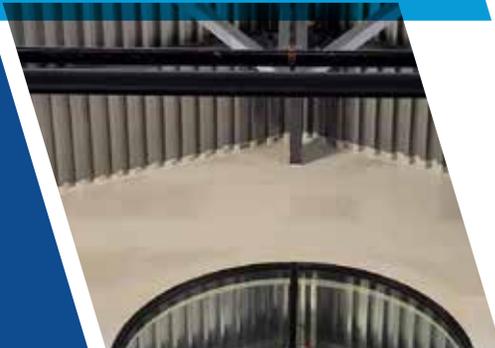

## CAULKING

Exterior sealants are a barrier from water, air, sound and dust. Caulking sealants provide a waterproof, flexible division between different types of construction materials. Minor damage to exterior sealants can compound quickly and eventually lead to major building repairs and tenant displacement. It is recommended to replace sealants roughly every 12 years.

- + Precast to precast joints
- + Window frames to structure
- + Door frames

## FIRESTOPPING

Firestopping is an essential part of the construction and maintenance process, and is ultimately responsible for saving lives, property value, and minimizing major environmental impacts due to fire.

Firestopping is the application of fire rated products to fire rated construction assemblies to achieve a continuous fire rating.

- + Firestopping at new and existing penetrations through rated assemblies
- + Firestopping at new and existing construction joints
- + Smoke seals to new and existing joints and penetrations
